

The Standards for Mathematical Practice describe the skills that mathematics educators should seek to develop in their students. The descriptions of the mathematical practices in this document provide examples of how student performance will change and grow as they engage with and master new and more advanced mathematical ideas across the grade levels.

**MP.1 Make sense of problems and persevere in solving them.**

Students learn that patience is often required to fully understand what a problem is asking. They discern between useful and extraneous information. They expand their repertoire of expressions and functions that can be used to solve problems.

**MP.2 Reason abstractly and quantitatively.**

Students extend their understanding of slope as the rate of change of a linear function to comprehend that the average rate of change of any function can be computed over an appropriate interval.

**MP.3 Construct viable arguments and critique the reasoning of others.**

Students reason through the solving of equations, recognizing that solving an equation involves more than simply following rote rules and steps. They use language such as “If \_\_\_, then \_\_\_” when explaining their solution methods and provide justification for their reasoning.

**MP.4 Model with mathematics.**

Students also discover mathematics through experimentation and by examining data patterns from real-world contexts. Students apply their new mathematical understanding of exponential, linear, and quadratic functions to real-world problems.

**MP.5 Use appropriate tools strategically.**

Students develop a general understanding of the graph of an equation or function as a representation of that object, and they use tools such as graphing calculators or graphing software to create graphs in more complex examples, understanding how to interpret results. They construct diagrams to solve problems.

**MP.6 Attend to precision.**

Students begin to understand that a rational number has a specific definition and that irrational numbers exist. They make use of the definition of function when deciding if an equation can describe a function by asking, “Does every input value have exactly one output value?”

**MP.7 Look for and make use of structure.**

Students develop formulas such as  $(a \pm b)^2 = a^2 \pm 2ab + b^2$  by applying the distributive property. Students see that the expression  $5 + (n - 2)^2$  takes the form of 5 plus “something squared,” and because “something squared” must be positive or zero, the expression can be no smaller than 5.

**MP.8 Look for and express regularity in repeated reasoning.**

Students see that the key feature of a line in the plane is an equal difference in outputs over equal intervals of inputs, and that the result of evaluating the expression  $\frac{y_2 - y_1}{x_2 - x_1}$  for points on the line is always equal to a certain number  $m$ . Therefore, if  $(x, y)$  is a generic point on this line, the equation  $m = \frac{y - y_1}{x - x_1}$  will give a general equation of that line.
